Tob Bicar! Is/ iMaiTie! Job Portal

Job Portal Management System

Full Stack Developer Internship Mini Project

Developed by: Yadul Raj — Organization: Softronics — Date: July 2026

Project Overview

This project is a web-based Job Portal Management System built with Python Django. It centralises job postings, applications and company profiles to streamline recruitment and job discovery.

Purpose

Create a reliable, responsive platform for recruiters and job seekers.

Objectives

Implement secure authentication, CRUD job workflows, search & filtering, and an admin dashboard.

Problem Statement

- Inefficient manual recruitment workflows and slow candidate screening.
- Poor visibility for job seekers; inconsistent job data.
- Lack of centralised tools for companies to manage postings and applicants.

❏ A lightweight portal reduces time-to-hire and improves matching accuracy.

Proposed Solution

The Job Portal provides a secure, role-based web application where recruiters post jobs and candidates apply. It offers search, filters, file uploads, and dashboards to manage the hiring lifecycle.

Faster Hiring

Streamlined posting → application → review flow reduces admin overhead.

Better Matching

Search and filters help candidates find relevant roles quickly.

Secure & Auditable

Role-based access and messages ensure secure interactions.

Technology Stack

Frontend

- HTML5, CSS3
- Bootstrap 5 (responsive UI)
- JavaScript (dynamic interactions)

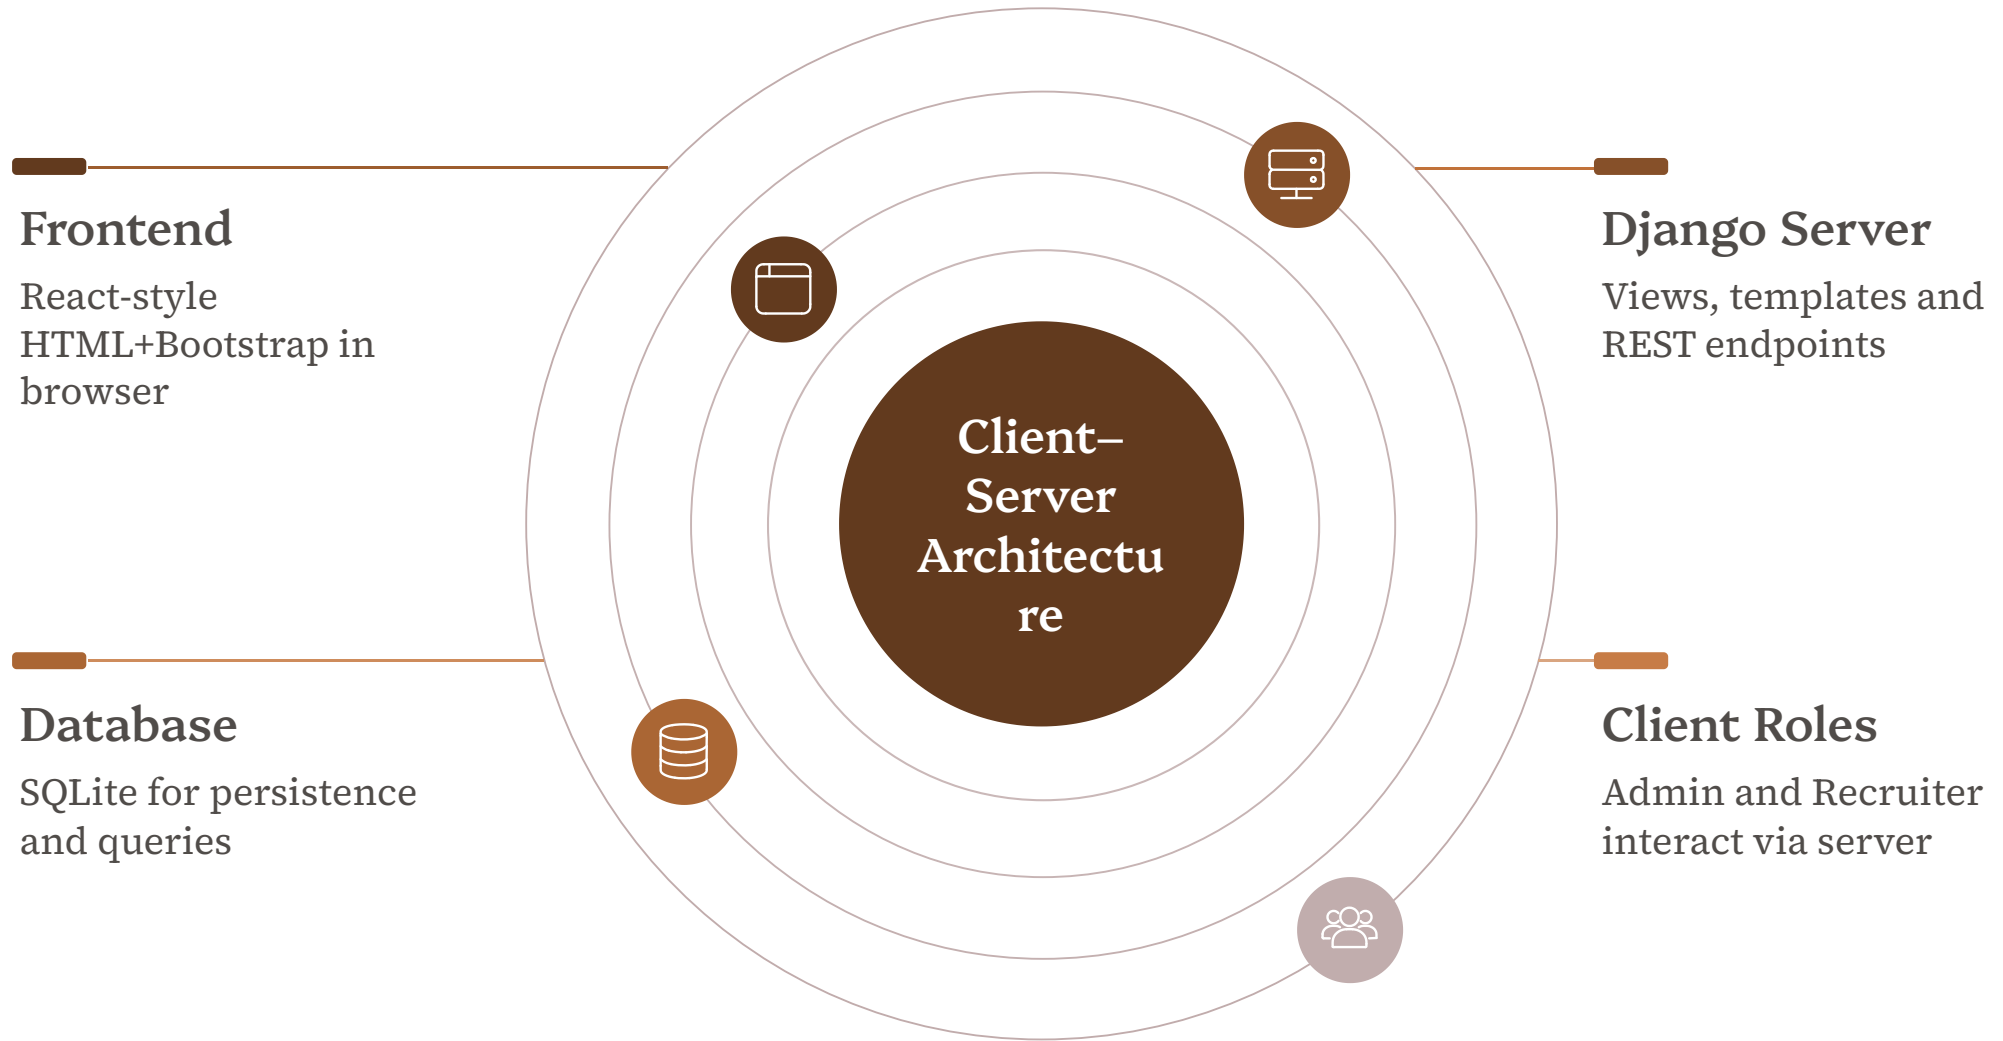

Tools

VS Code, Git, GitHub

Backend & Data

- Python
- Django (MVC, ORM, auth)
- SQLite (development DB)

Stack chosen for rapid development, maintainability and clear learning outcomes.

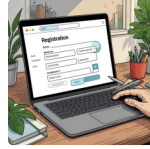

Architecture: Browser → Django application (views, templates, REST endpoints) → SQLite. Admin and Recruiter roles interact through the server; static assets served by Django.

System Modules

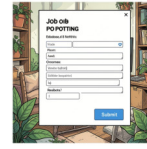

Authentication

Sign up, login, password management, Django auth integration.

User Registration & Login

Role selection (candidate, recruiter, admin) and profile management.

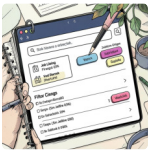

Job Management (CRUD)

Create, read, update, delete job postings with file attachments.

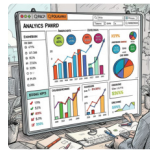

Company Management

Company profiles, logos, and verified contact details.

Search & Filtering

Full-text search, location and category filters, pagination.

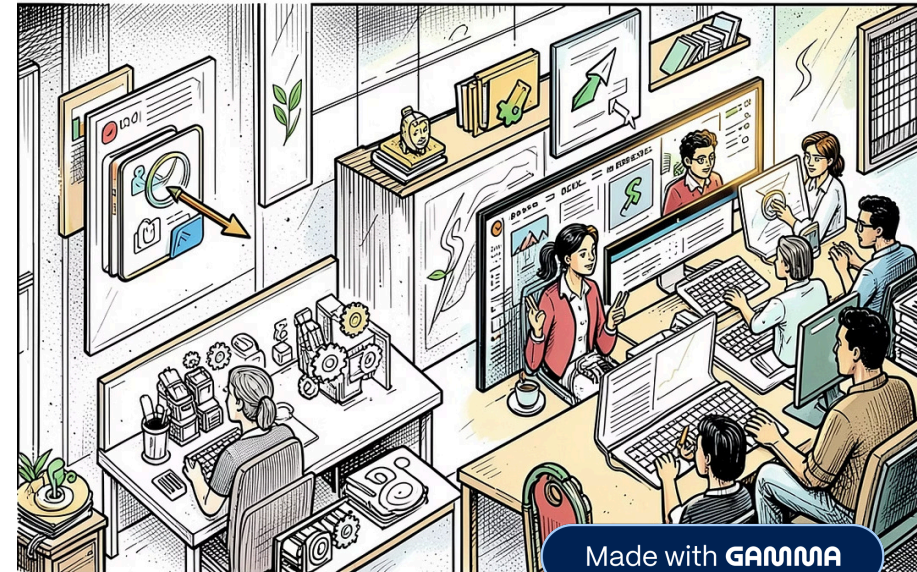

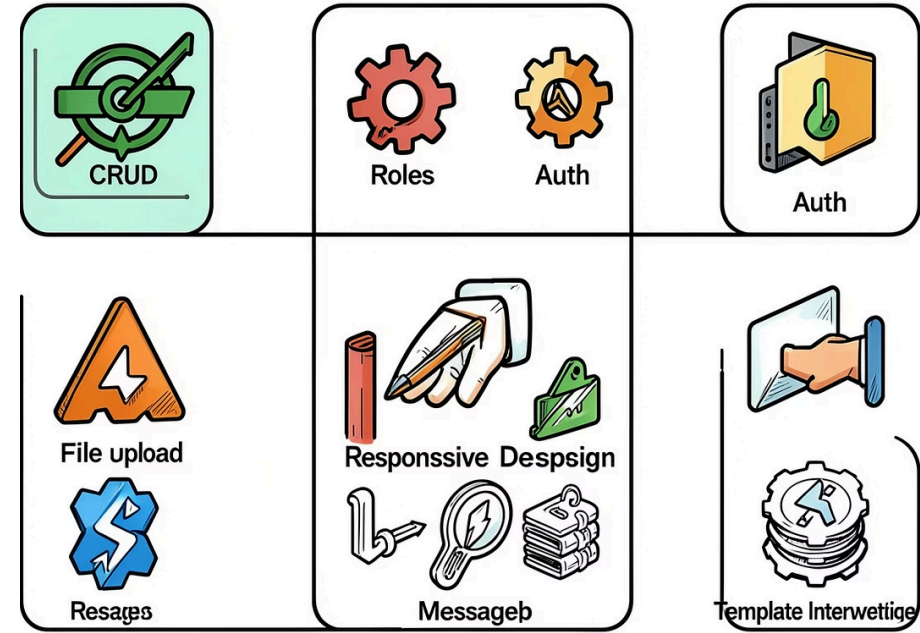

Dashboard & Admin Panel

Role-specific dashboards for recruiters and admin controls.

Key Features

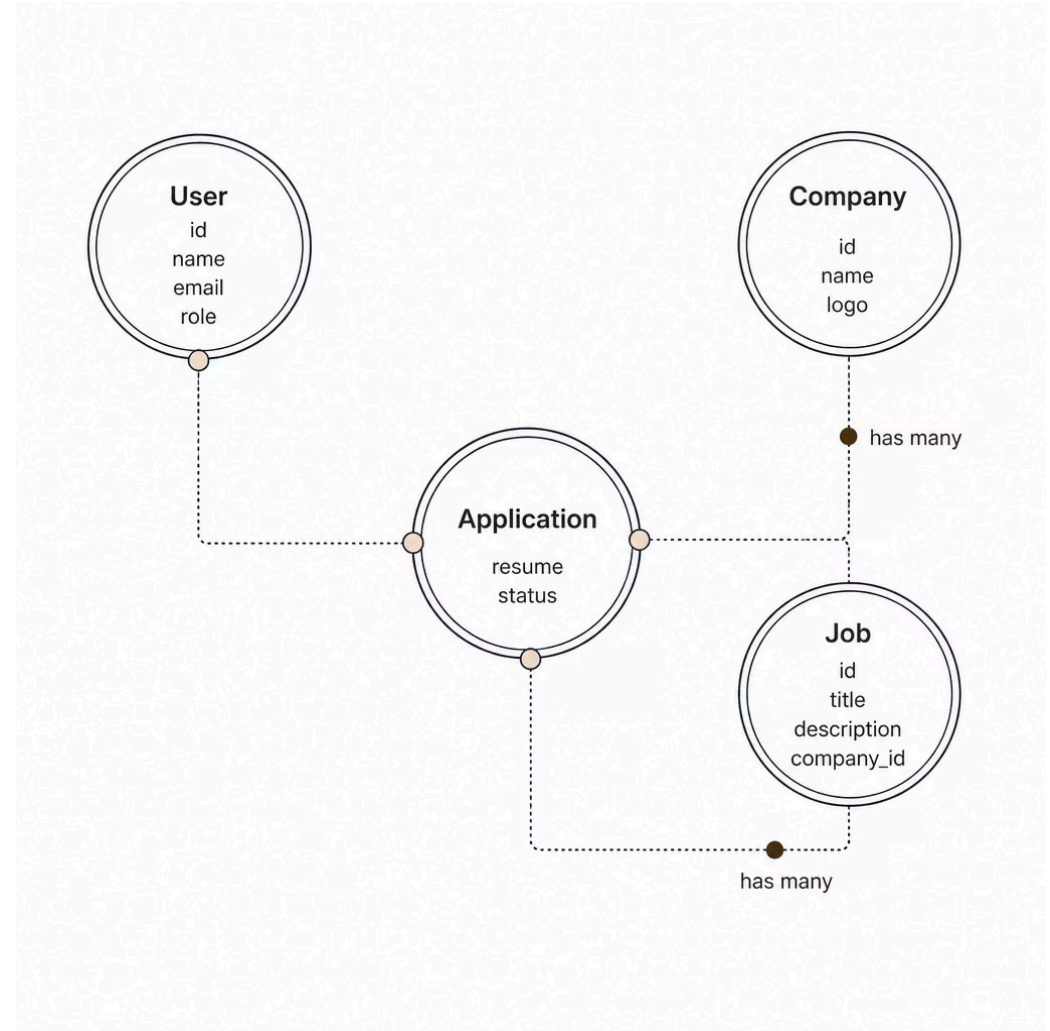

- CRUD Operations for Jobs & Companies
- Role-Based Login & Authorization
- Authentication (Django auth)
- Template Inheritance for consistent UI
- File Upload: Resumes & Company Logos
- Search & Filter Jobs (keyword, location, category)
- Responsive Design with Bootstrap 5
- Django Messages for user feedback
- Admin Panel for content moderation

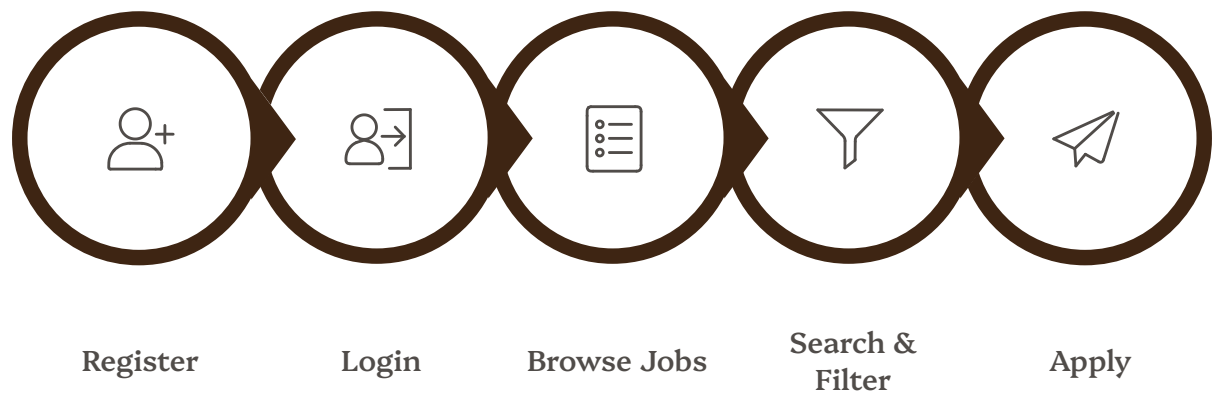

Database Design

Core entities modelled with Django ORM:

- User (extended profile, role)
- Company (name, logo, details)
- Job (title, description, requirements, company FK)
- Application (candidate FK, job FK, resume, status)

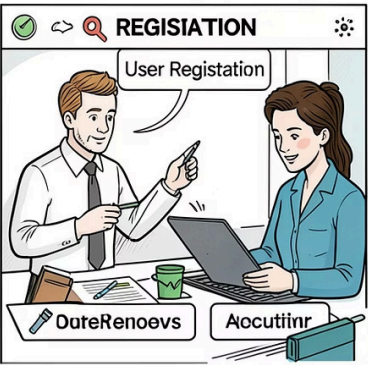

Project Workflow

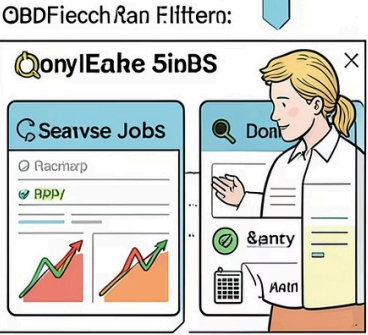

The diagram summarises the user journey and administrative review loop. Each step maps to views, forms and model interactions in Django.
